

Waterproofing Experts Designs and Installs Metal Wall Panels

Waterproofing Experts is excited to announce its service for the design and installation of architectural panels, for walls, ceilings and roof assemblies.

We offer both design and installation for the commercial and residential industry; with our in-house metal trim forming capabilities, for quick turnarounds to keep the projects on schedule and on budget.

Metal wall panels offer a wide variety of design capabilities and a sustainable weather barrier solution. Some benefits of using

metal wall panels compared to stucco, and/or wood sidings are the low maintenance cost, durability, and easy to clean.

Here are some of our recent projects completed in 2019:

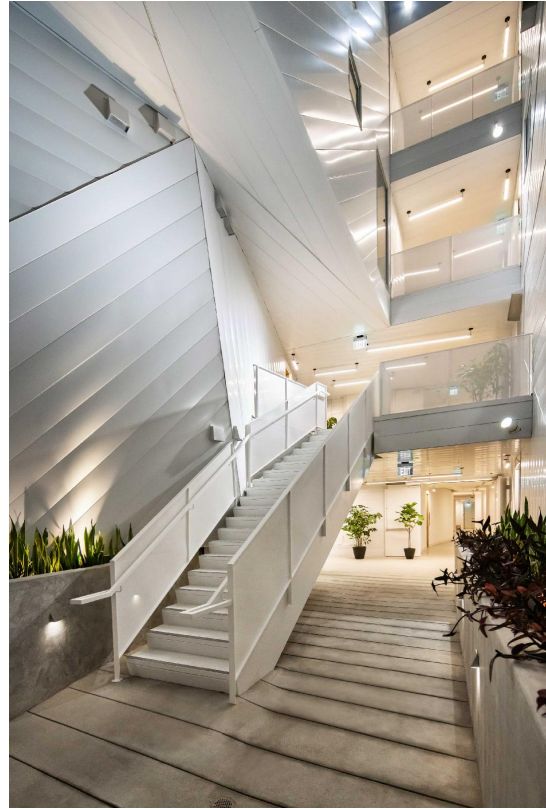

1030 Kings Road- West Hollywood

This 32 unit condo is located in the heart of West Hollywood. Waterproofing Experts installed a combination of solid, perforated, and ribbed white metal panel to project the vibrancy embedded within the project's form and functions. This unique designs exemplifies the vibrancy as well as the privacy of the building.

Corrugated, Metal Balcony for Privacy

Front Staircase with Flushed Metal Panels and White Linen Finish

7014 Willoughby Street- Central Hollywood

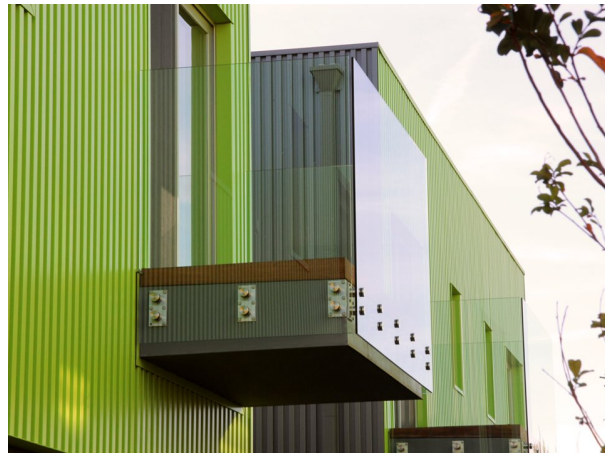

This project was completed a few years ago.

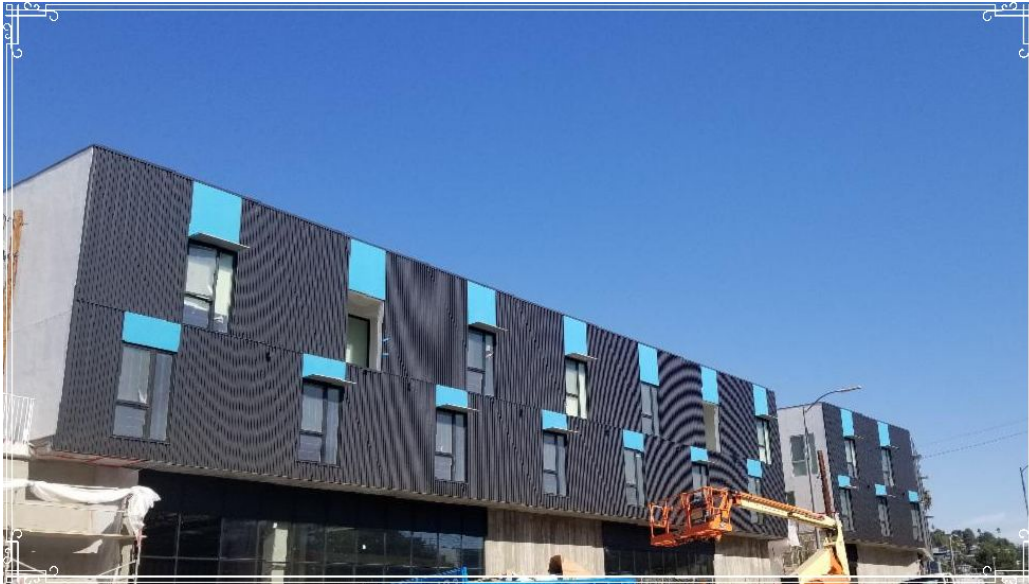

The bright colored corrugated metal adds an element of contrast in combination with the dark gray stucco used at the same elevations. This is not only an aesthetic decision, but the reflected natural light into units is one of several passively sustainable strategies. The composition of solid metal siding animate the street-facing elevations for a more accessible relationship with the surrounding context.

Beautifully aesthetic

Metal panels create a beautiful appearance for exterior and interior applications. Shiny and matte finishes can be shaped into a wide array of patterns, to look ultra-modern or vintage.

4121 Santa Monica – Mixed Use

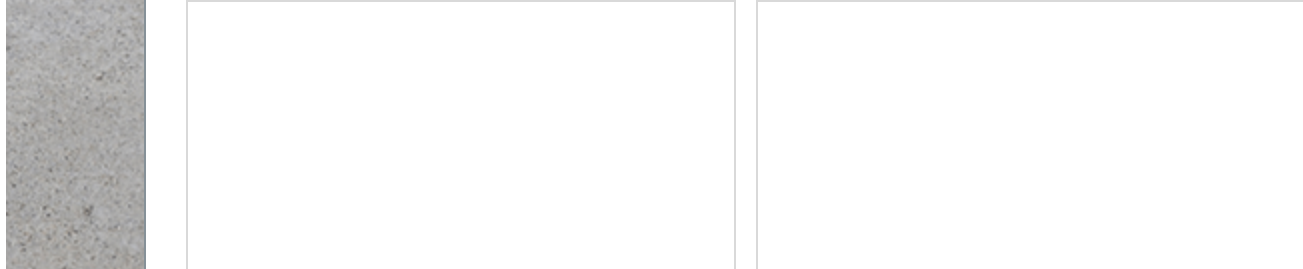

This mixed used project located in Santa Monica Blvd has 41 residential units and is also home to the Erewhon Market.

We installed a concealed fastener metal panel system over hat channel assembly that provides ventilation to the building structure behind the Architectural cladding. The design breaks down the scale of a typical housing project and incorporates residential and pedestrian experiences at the street level.

617 Dillon Street- Silverlake Neighborhood in Los Angeles

Located on a narrow lot in Silver Lake, Los Angeles, LOHA's newest housing project, Dillon617 creatively integrates open and community space into dense urban development, providing essential housing for this growing community. These exterior metal panels bring out the essence of the building.

The design of Dillon617 is derived from two long bars connected by an outside walkway and pushed to one side of the property to assign a significant part of the site to a landscaped walk.

The dark metal exterior adds a contrast element by incorporating a bright white inner aisle. This is not only an aesthetic decision, but the natural light reflected in the corridors and units is one of several passively sustainable strategies.

Low Maintenance Cost

Metal wall panels can be installed more quickly than brick, granite, precast and other materials. They're typically lighter, requiring less supported structure.
